TITLE: Czechoslovak Patent Number PV 2473-61

SOURCE: Vynalezy, no. 1, 1966, 9-10

TOPIC TAGS: semiconductor material, magnetic dipole

ABSTRACT: This is a method of preparation of a solid body which, with regard to periodic currents, has the properties of a predetermined passive dipole. The body consists of several parallel branches, one of which is formed by predetermined capacitance  $C$ , the next branch is formed by predetermined resistance  $R$ , and each other  $n$  branch consists of a serial combination of predetermined capacitance  $C_i$  and predetermined resistance  $R_i$ , where  $i = 1, 2, \dots, n$  ( $n \neq 1$ ). At the same time the predetermined capacitances  $C_i$  are finite and different from zero, predetermined resistances  $R_i$  are finite and different from zero, the predetermined capacity  $C$  is finite but not necessarily different from zero, the predetermined resistance is different from zero but not necessarily finite, and at least two parallel branches of the dipole have finite impedance for periodic currents which is characterized by the fact that a single dielectric is formed with the tangents of the loss angle larger than 0.1 and

Card 1/3

ACC NR: AP6005484

static permittivity  $\epsilon_s$ , optical permittivity  $\epsilon_r$ , electric conductivity  $g_s$ , optical conductivity  $g_r$ , and relaxation period  $p_i$  ( $i = 1, 2, \dots, n$ ) of its  $n$  dipoles ( $n \geq 1$ ) satisfy the following relations:

$$\frac{\epsilon_r}{\epsilon_s} \frac{C}{C + C_1 + \dots + C_n} \text{ for } C \neq 0 \text{ and } \frac{\epsilon_r}{\epsilon_s} \leq 10^{-3} \text{ for } C = 0,$$

$$\frac{g_r}{g_s} = R \cdot \left( \frac{1}{R} + \frac{1}{R_1} + \dots + \frac{1}{R_n} \right) \text{ for } R \neq 00 \text{ and } \frac{g_r}{g_s}$$

$$\leq 10^{-3} \text{ for } R = 00, \frac{\epsilon_r}{g_r} = \frac{C}{\frac{1}{R} + \frac{1}{R_1} + \dots + \frac{1}{R_n}}$$

$$\text{for } C \neq 0 \text{ and } \frac{C_r}{g_r} \leq 10^{-6} \text{ sec for } C = 0, t_1 = R_1 \cdot C_1,$$

where the values  $C$  and  $C_i$  ( $i = 1, 2, \dots, n$ ) are expressed in faradays of the value  $R$  and  $R_i$  in ohms. At the same time,  $1/R$  means 0 for  $R = 00$ , the values  $\epsilon_r$ ,  $\epsilon_s$  are expressed in F/cm, and the values  $g_r$ ,  $g_s$  are expressed in ohm<sup>-1</sup> cm<sup>-1</sup>. After that we used the

Card 2/3

ACC NR: AP6005484

material to prepare the solid body in such a way that its thickness  $A$ , measured in centimeters in the direction of the electric pole which acts on the body and the cross section  $S$  of the body measured in  $\text{cm}^2$  perpendicularly, to the indicated direction satisfies the relationship:

$$\frac{S}{A} = \frac{1}{g_r} \cdot \left( \frac{1}{R} + \frac{1}{R_1} + \dots + \frac{1}{R_n} \right).$$

Patent applied for on 24 April 1961 (PV 2473-61).

5000. Continuous colorimetric determination of small amounts of oxygen in ethylene. M. Struszyński, L. Minczowski, S. Waszak and J. Wacławik *Przem. Chem.* 1953 32 (9), 440-457. L. J. Brady's method (*Brit. Abstr. C*, 1940, 203),

which is based on the change of colour of an alkaline soln. of reduced sodium anthraquinone- $\beta$ -sulphonate by oxygen, has been modified and adapted for continuous recording of oxygen contents from 0.002 to 0.02 per cent. in  $C_2H_4$ , with an absolute error of  $\pm 0.0005$  per cent. The range of measurements can be extended to 0.1 per cent. by adjusting concn. of the reagent, diameter of capillary and flow of  $C_2H_4$ . The prep. of reagents, assembly and calibration of the apparatus and the procedure are described in detail. Diagrammatic sketches, calibration curves and a survey of literature are presented. H. BURSTIN

Waszak, Stefan

A colorimetric apparatus for examining gases. I. Continuous determination of small amounts of oxygen. Stefan Waszak (Gen. Chem. Inst., Warsaw). *Chem. Abstr.* (Warsaw) 2, 376-311, 1957 (English and Russian summaries).  
 An app. was constructed for continuous colorimetric det. of O in H<sub>2</sub> or in gases contg. H<sub>2</sub>. The method is a modification of that by Brady (cf. C.A. 43, 1286a). By introducing some improvements, e.g., a special system of capillaries, it is possible to det. O in two concn. ranges: from 0.00 to 0.10% and from 0.01 to 0.00% vol. The error was  $\pm 6\%$ . Methods found in the literature are discussed.

Continuous Determination of Small Amounts of Oxygen.

Orig Pub: Chem. analit., 1958, 2, No 4, 376-384.

Abstract: An improvement of the previously developed method (RZhKhim, 1953, 41715), based upon the principle of the method of Brady (Brady L., Analyt. Chem., 1948, 20, 1033):  $O_2$  decolorizes an alkaline solution of Na-beta-anthraquinone sulfonate and the coloration of the solution is measured with a photocolormeter. The reagent is regenerated by

Orig Pub: Pomiar, Automat, Kontrola, 4, No 5-6, 228-231 (1958)  
(in Polish with German and Russian summaries)

Abstract: A gas analyzer (GA) has been developed for the determination of Cl traces with continuous regeneration of the circulated reagent. The apparatus operates on the basis of the reaction of Cl with a buffered KI solution (pH 7). After the reaction the solution takes on a yellow color the intensity of which is

proportional to the Cl content in the analyzed gas. The intensity of the color of the solution is continuously measured with a differential colorimeter with two selenium photocells and the result of the analysis is recorded with a recording milliammeter. The gas to be analyzed enters the GA at a constant flow rate and is contacted with the continuously renewed clear solution in a coiled tube. After passing through the tube, the gas is purified from entrained liquid droplets in a separator and exhausted; the colored portion of the solution is drained into one of two colorimetric cuvettes, after which it is passed through a regenerating section packed with activated coal and returned through a second cuvette to the coil.

Watorski K. The Influence of Fundamental Organic Radicals upon the Toxicity of Chemical Compounds.

POL.

„Wplyw podstawowych rodników organicznych na toksycznosc zwiqzkow chemicznych”. Ochrona Pracy, No. 5, 1951, pp. 155-159.

Review of the influence exerted by various organic radicals upon the toxic effect, on living organisms, of various organic compounds. Influence or spilling of certain organic radicals may either increase or decrease the toxicity of the chemical compound, or not modify it in any way. It has hitherto not been possible to fix a general law likely to cause a variation in the toxicity of organic compounds. Consideration is given to the fact that the toxicity of a compound depends on its solubility in water (insoluble compounds are not toxic), to the presence of other radicals increasing its toxic effect, and to the position in the compound of any given radical. The author specifies 38 of the most important organic radicals, and their toxic effect.

649. WATORSKI K. Inst. Med. Pracy w Rokitnicy; Terenowa Stacja Toksykol. w Gliwicach. \*Ostre i lekkie zatrucia związkami manganu. Acute and mild poisoning caused by manganese compounds MED. PRACY 1955, 6/1 (15-22)

These compounds caused acute poisoning (sudden onset, circulatory disorders, slight loss of consciousness, grave dyspnoea) in 7 out of 19 workers. The milder forms showed only irritation of the respiratory tract, headache, cough, weakness and skin ulcerations. The manganese compounds exert their toxic action even after a short contact, depending on their chemical pureness and on the high concentration of dust. The prophylaxis, diagnosis, prognosis and treatment are discussed.

Ceramic tiles as a facing for the outer walls are durable, relatively  
light, and less expensive than natural stone facings. The sizes and  
shapes of facing elements depend on where they are used and on the  
method of fitting. The tiles are laid either on walls already erected  
(surface facing), or when the walls are being built (constructional fac-  
ing). Recent experience has shown tiles to be an extremely valuable  
facing material of many uses in finishing the elevations of buildings.

SOURCE: Przegląd epidemiologiczny, v. 19, no. 3, 1965, 393-395

TOPIC TAGS: drug treatment, bacteriology, epidemiology, infectious disease, drug

ABSTRACT: A clinical analysis of 100 cases of paratyphoid B fever from the Rzeszow epidemic in 1963 is presented. Bacteriologic confirmation was obtained in 67 percent of cases, and the Widal test was positive in 71 percent. No complications were observed. The patients were treated with detreomycin in doses of 50 mg per kg body weight during the febrile period. [Based on authors' Eng. abst.] [JPRS]

AUTHOR: Wawrzyczek, Wiktor

TITLE: Oxidation of aniline by means of ultrasonic waves

PERIODICAL: Przemysł Chemiczny, v. 40, no. 1, 1961, 41-43

TEXT: This is the reprint of a lecture, delivered during the VII Open Seminary on Acoustics in Gliwice in July 1960. In the introductory part of his lecture, the author discussed briefly the findings of various scientists, published in scientific periodicals. Chemical processes taking place in supersonic field are various and numerous, e. g. oxidation, reduction, analysis, synthesis, polymerization, depolymerization, etc. In order to elucidate chemical processes taking place under the influence of supersonic waves, Lindström and Lamm (Ref. 3: O. Lindström, O. Lamm, I. phys. Colloid Chem., 55, 1139 (1951) have assumed that the basic reaction taking place is the decomposition of water into radicals  $H_2O = H + OH$ . By means of this, several processes can be explained. In the second part of his lecture, the author described the experiments of aniline oxidation by ultrasonic waves. For these experiments 0.5, 1, 2 and 3% aniline solution in twice distilled water were used. Exposition to supersonic wave action was carried out in exactly similar vessels, each containing 50 mls of respective;

# Oxidation of aniline by means of ultrasonic waves

aniline solution. The magnetostriction transducer of 5.1 cm<sup>2</sup> radiation surface was air cooled, so that the initial temperature of the solutions (17 - 18°C) rose by 4 - 7°C only, depending on time of ultrasonic vibration. Before being exposed to supersonic waves, all solutions were saturated for 10 minutes with pure oxygen at atmospheric pressure. The supersonic radiation lasted only 2 minutes and during this time small quantities of oxygen at the rate of 35 - 40 bubbles per minute were allowed to pass through the liquid. Vibration frequency applied was 21 kc/s and 4.5 w/ml of solution. It was found that, following the action of supersonic waves, various aniline oxidation products were formed:

## Aniline concentration

## Dyestuff obtained

0.5%	violet	) not identified
1.0%	violet-blue	
2.0%	orange,	identified as azobenzene
3.0%	black with greenish tint,	identified as a mixture of aniline black and unidentified green dye.

Discussing the orange dye, the azobenzene, the author thinks that at first the aniline decomposes into radicals c1ccccc1[NH] and c1ccccc1[N] (1) which, being unsaturated, react between themselves as follows:

Oxidation of aniline by means of ultrasonic waves

23309  
P/14/61/040/001/007/007  
A221/A126

Most likely, at first, in the presence of oxygen the hydrazobenzene is formed which under influence of OH and HO<sub>2</sub> radicals oxidizes according to the following equation:

and

The reaction between radicals themselves, too, must not be excluded.

The influence of ultrasonic vibration time on aniline-black formation was also investigated. Equal quantities of 3% aniline solutions were exposed at the temperature 17 - 18°C for 1, 2, 3 and 4 minutes to the supersonic vibration and

Card 3/4

P/014/61/040/001/007/007  
A221/A126

Oxidation of aniline by means of ultrasonic waves

with simultaneous admission of 35 - 40 bubbles of oxygen per minute. After 1 and 2 minutes of exposition mainly green dyes were obtained, probably emeraldine, nigraniline and pernigraniline. In samples exposed to 3 and 4-minute supersonic action mainly aniline black not turning green was obtained. This process is highly complicated and not yet defined. During the course of investigations it was found that increased oxygen partial-pressure does not intensify the process of oxidation. Investigations on water solutions of aniline in the presence of inert gases, in particular of argon, are in progress. There are 1 table and 23 references: 6 Soviet-bloc and 17 non-Soviet-bloc. The reference to the most recent English-language publication reads as follows: O. Lindström, I. Acoust, Soc. Amer., 27, 654 (1955).
